

BLADELOOP

Take the order, set the plant, see what you made.
The plant now runs end to end.

Until now, the process. Today, the plant it runs.

Nine sprints explaining how a blade becomes fibre, oil, gas and char.

SPRINTS 1 — 9

The process

What happens inside the kiln

Chemistry, geometry, timing

SPRINT 10

The product

Who runs the plant, and why

One order, planned end to end

BladeLoop is not a diagram of pyrolysis. It is the tool someone uses to decide how to run it.

Today I am a production planner.

An order has just come in. This is how I would plan it.

01

TAKE THE ORDER

A buyer, a grade, a tonnage.

02

SET THE PLANT

Temperature, retention, feed rate, particle size.

03

SEE WHAT I MADE

Did I fill the order — and what did it cost me?

There is no correct setting: filling the order quickly and sparing blade material pull against each other.

D E M O

Demo.

Two things.

01 Minor bug fixes

02 Final report

QUESTIONS?

Thank you.
